Prepare for the future – combine AI, problem solving & collaboration

Many statistical organizations approach changes using scattered tools, including AI-tools, complex guidelines, and one-off workshops that often fail to deliver lasting impact. AI-CATCH introduces a new approach. It's a generative AI-powered framework that integrates structured problem-solving, AI insights, and human collaboration.

Improve these five skills

AI-CATCH is built around five key skills that transform how change is designed, implemented and sustained.

Change as Structured Problem-Solving: From scattered change efforts to a clear, step-by-step path from current to desired situation based on how NSO subsystems interact

AI as Exploratory Partner: From relying solely on experts and guidelines to using AI as a sparring partner that brings insight and options.

Transform Generic Knowledge to Context-Specific Knowledge. From generic complex guidelines to tailored solutions, where AI-CATCH adapts standard frameworks to your organization's specific context.

Co-Creation with Stakeholders: From top-down directives to collaborative workshops that build ownership and engagement.

Hold on and Sustain Change: From quick fixes to continuous improvement supported by organizational memory

Get the benefits

- *Efficiency:* Streamline decision processes and reduce manual workload.
- *Sustainability:* Build a coordinated, agile organization that holds on to change.
- *Skills Development:* Equip teams with modern AI tools and collaborative methods.
- *Quality & Compliance:* Align with UN NQAF, GSBPM, GAMSO, and other standards in official statistics.

How it works

Organizations start by outlining their current situation and issues. AI-CATCH creates customized solutions aligned with quality frameworks, best practices, and organizational needs. These options undergo collaborative review, allowing the organization to choose a suitable path forward.

Key facts

AI-CATCH
- is preloaded with problem solving procedures, best-practices and reference models selected by Lars Thygesen and Mogens Grosen Nielsen, based on 30+ years of experience in production of official statistics
- includes 25+ use cases supporting many areas in the production of official statistics
- is based on solid theories and experience on production of official statistics, on how AI can augment human intelligence, and on how organizations work.
